

Multi-Columnar Report

Web services technology connects two applications using XML-based protocols. An application requests a service from another cooperating application by sending an XML-based message to it. This message is called a SOAP request. The request message embeds a method call for the remote application. The message contains the parameters required by the remote method. The remote application after

providing the service to the requestor may send a response to it by sending another XML-based message. This message is a SOAP response and contains the return value of the remote procedure call.
